

## JSX Topics Roadmap for Beginners

1. Basics of JSX
2. What is JSX and why React uses it
3. JSX syntax rules
4. Returning JSX from a component
5. Single parent element requirement
6. Embedding JavaScript in JSX
7. Using `{}` to embed JS expressions
8. Displaying variables and values
9. Performing inline calculations
10. Conditional expressions (`? :`) in JSX
11. Logical AND (`&&`) for conditional rendering
12. Lists and Rendering Multiple Elements
13. Using `Array.map()` to render lists
14. Using `key` prop for list items
15. Attributes in JSX
16. `className` vs `class`
17. `htmlFor` vs `for`
18. Other HTML attributes in JSX (`id`, `src`, `alt`, `type`, etc.)
19. Event Handling
20. Handling events like `onClick`, `onChange`, `onSubmit`
21. Passing arguments to event handlers
22. Preventing default behavior (`e.preventDefault()`)
23. Components in JSX
24. Rendering other components inside JSX
25. Passing props to components
26. `Children` prop (`props.children`)
27. Conditional Rendering

- 28. if-else outside JSX
- 29. Ternary operators inside JSX
- 30. Logical AND (&&) shorthand
- 31. Fragments
- 32. `<React.Fragment>` or `<>...</>`
- 33. Avoiding unnecessary extra `<div>` wrappers
- 34. Styling in JSX
- 35. Inline styles using objects
- 36. Dynamic class names using expressions
- 37. JSX Best Practices
- 38. Keeping JSX readable (splitting into smaller components)
- 39. Avoiding too much logic inside JSX
- 40. Self-closing tags (`<img />`, `<input />`)
